Description of Blue Star Item	The site utilises a call button system to facilitate access and egress from the site which is situated in the middle of a busy 3 lane roundabout. The button is linked to the roundabout traffic light set and by engaging it the operatives can hold the red light for an extra 10 seconds within a certain part of the sequence. This allows vehicles sufficient time to arrive at and leave site safely without disrupting traffic. A QR code is visible on the main control which, when scanned, directs the operator to a video on YouTube which shows how to use the system. https://youtu.be/xwgMxjzX1U0
Benefits of Blue Star Item	The development of the call button has allowed the works on site to be delivered during daytime hours. This has resulted in an increase in productivity, enhancement of H&S as works being carried out on days is inherently better than at night, higher quality of works and greater engagement from the supply chain to deliver the works. As the project is being delivered predominantly on days, a larger cross section of the supply chain is interested in tendering for the various packages of works. There is also an increased “public visibility” of the works. As members of the public are driving by, then see people working and see the progress as time goes on. This helps alleviate the number of HAILS being raised as to what the works are.
Details and Cost of any Specific Product	Amendment to the Traffic singles and other ancillary works were approx £10k
